

Database System Final Project Proposal

Jason Christopher C

Arkaan Nofarditya A

Farras Yamin

Idea:

For this project, my group chose to create a simple database system for a computer parts store. The system will allow the store owner/manager to insert or access the current stock of computer parts in the database. The database will also allow the store owner/manager to organize the different categories of parts.

Background:

We decided to make a database system for a simple computer parts store because our team is interested in computers. We know there are many parts that are in the store's inventory, so we thought making a database for a computer parts store will teach us to design a multipurpose database for the computer parts store so the owner/manager can manage the store's inventory easily.

My Role:

- **Jason Christopher Chandra:** Building the Database using MySQL.
- **Arkaan Nofarditya Ashadi:** Design and code the database for the store using Visual Basic.
- **Farras Yamin:** Design and Create the ERD & User Manual.
